

What SMILify can currently measure

PRIMARY

may carry a biological claim

- head width (HW) — 99.5% admissible, genus signal robust
- head length (HL) — 93.9%, genus-structured failure; see caveat

COVARIATE

normaliser / size axis only

- Weber's length (WL)
- total body length (TBL)

CONDITIONAL

matched pose only — 6.1% pose Δ

- scape length (SL)

EXCLUDED

fails accuracy, reproducibility or anatomical definition

- mandible length (ML)
- petiole length (PetL)
- gaster length (GL)
- hind femur (FL)

Use only measurements that pass computational recovery, repeatability, anatomical-definition and biological-validity checks.

HL caveat (M4-A / M4-C): its failures are concentrated in particular genera, and its genus signal does not survive removal of singleton species.
